Covid-19 treatments and their role in war against pandemic

About the authors

Professor Dian-Son O’Cull, who is the chairman of the Experimental Drug Development Centre at the Singapore National University, is the author of a recent report on the war against Covid-19. The report highlights the importance of finding effective treatments for Covid-19, which has led to significant changes in the drug development industry.

The report explains that the Coronavirus disease (COVID-19) pandemic has resulted in a surge of interest in the development of new drugs to treat the disease. This has led to the creation of new partnerships between academic institutions and pharmaceutical companies, which are working together to develop new treatments.

The report also notes that the pandemic has created a demand for more effective treatments, which has led to an increase in the number of clinical trials being conducted. These trials are designed to test the safety and efficacy of new drugs, and to determine whether they are effective in treating Covid-19.

The report concludes by stating that the war against Covid-19 is far from over, and that there is still a need for more effective treatments. It calls for continued investment in drug development to help ensure that the world is better prepared for future pandemics.
