

## APPENDIX 1. REPRESENTATIVE LESSON ACTIVITIES

PC1 Laboratory-based Questions (LBQ)	Laboratory Tasks	Sample Post-laboratory Test
<p>(1) A 50.0 mL stock solution was prepared by dissolving 14.0 g of KOH in water.</p> <p>(a) Calculate stock [KOH].</p> <p>(b) Give detailed procedures to prepare 250 mL of 0.5 M KOH from stock solution.</p> <p>(2) Refer to the practical task. Will adding more water affect the aim of the experiment?</p>	<p>(a) Do a 10-fold dilution of stock NaOH solution (unknown analyte)</p> <p>(b) Add about 0.25 g of potassium hydrogen phthalate (KHP) in a conical flask. Dissolve the solid with deionized water</p> <p>(c) Titrate diluted NaOH in burette with KHP solution</p> <p>(d) Calculate original stock [NaOH]</p>	<p>Reversed protocol:</p> <p>(a) A known volume of the NaOH standard solution (10-fold diluted) pipetted into a conical flask.</p> <p>(b) Prepare 250 mL of precise 0.01 M KHP using a volumetric flask</p> <p>(c) Titrate solution (i) with (ii) in a burette</p> <p>Question:</p> <ul style="list-style-type: none"> <li>Describe procedures to prepare solution (b)</li> </ul>
OC Laboratory-based Questions (LBQ)	(Not used for analysis)	
<p>Build the molecular model of this molecule in your tutorial sheet. Identify if it is (<i>R</i>) or (<i>S</i>) configuration. (Traditional classes need only to identify configuration)</p>	<ul style="list-style-type: none"> <li>Construct models of various molecules to show <i>meso</i>, enantiomers, diastereomers</li> </ul>	<p>Which of the following is the correct name for the model shown?</p>  <p>a) (<i>R</i>)-1,1-dichloropropane  b) (<i>S</i>)-1,1-dichloropropane  c) (<i>R</i>)-1,2-dichloropropane  d) (<i>S</i>)-1,2-dichloropropane</p>
		
PC2 Buffer Preparation		
<p>No LBQ. Baseline tutorial objectives for traditional classes are:</p> <ul style="list-style-type: none"> <li>apply pH formula of buffer</li> <li>calculate acid dissociation constant <math>K_a</math> of a weak acid by formula</li> <li><math>K_a</math> by half-equivalence point (<math>\frac{1}{2}</math> eqv) on a titration curve</li> </ul>	<ul style="list-style-type: none"> <li>Lab 1: Microsoft excel dry lab</li> <li>Lab 2: traditional classes prepare buffer solutions with given procedures</li> <li>Lab 2 hybrid classes:</li> </ul>	<ul style="list-style-type: none"> <li>Write an equation to explain why a solution of <math>\text{NaHCO}_3</math> is basic</li> <li>Identify molecular species on a titration curve before, at and after neutralization</li> <li>Explain how to use a titration curve to compute <math>K_a</math></li> </ul>

- 
- (a) *In the last experiment, both you and your partner used Excel to determine the mass of CH<sub>3</sub>COONa to prepare 100 mL of pH 4, 4.5 and 5.0 buffer solutions*
  - (b) *In this lab, you would prepare them using the required reagents and glassware available in the lab.*
  - (c) *Review the questions in the last Microsoft Excel lab and Question 3 in Tutorial 1.2*
  - (d) *Discuss with your lab partner. Outline the steps required. Show your draft procedures to the instructor before starting benchwork*

- Lab 3 traditional classes:
  - (a) Compare pH changes when acidic impurities are added to water and buffer solutions
  - (b) Measure pH of basic salt solutions
  - (c) Identify ½ eqv on titration curve to obtain K<sub>a</sub>
- Lab 3 hybrid classes: baseline + extended activities:
  - (a) Write molecular species to explain why CH<sub>3</sub>COONa is basic, after measuring pH
  - (b) Explore how ½ eqv on titration curve reduces to K<sub>a</sub> mathematically

---

PC2 stereochemistry. No LBQ. Baseline tutorial objectives for traditional classes are:

- Compute metal M oxidation state
- Sketch structure of isomers of transition metal complexes with different geometries, for example, **M**(H<sub>2</sub>O)<sub>2</sub>Br<sub>2</sub> (square planar)

Traditional classes use molecular models to construct transition metal complexes of various geometries, for example:

- **M**(NH<sub>3</sub>)<sub>2</sub>Cl<sub>2</sub>
- **M**(NH<sub>3</sub>)<sub>4</sub>Cl<sub>2</sub><sup>+</sup>
- [**M**(en)<sub>3</sub>]Cl<sub>3</sub>

Hybrid classes: baseline + extended activities to explore the relationship between ligand nature, coordination number and isomerism. For example:

(Essay take-home test)

Comment as much as you can, on the important features of the given complex, for example, isomerism, shape, ligand type and so on.

---

- Determine if optical or geometric isomerism exists for a given structure, for example  $[\text{MCl}_4(\text{H}_2\text{O})_2]^{2+}$

- Start with a square planar complex  $\text{MA}_2(\text{en})$ , en = ethylenediamine. Connect the A ligands in a trans orientation. Then connect the two nitrogen atoms to the remaining positions. Can you fit the molecule well? What do you observe?
- So, how many ways can you arrange the A ligands and the en ligand?
- Summarize the conditions required for optical and geometric isomerism in 4-coordinated complexes
- Construct 6-coordinated complex  $\text{MA}_4\text{en}$ , with a bidentate ligand  $\text{H}_2\text{NCH}_2\text{CH}_2\text{NH}_2$  (en) and 4 identical A ligands. Sketch one possible isomer and construct a model of it.
- Try to construct the mirror image of  $\text{MA}_4\text{en}$ . Are the two models superimposable on each other?
- Now increase the number of en ligands to 2. Construct the 2 structures with 2 A ligands as far away, and near to each other as possible
- Summarize the conditions required for optical and geometric isomerism in 6-coordinated complexes
